

"Uzbekcosmos" at the "INNOPROM. Central Asia"

The sixth international industrial exhibition, "INNOPROM. Central Asia," opened at the CAEx exhibition complex in Tashkent. This prestigious event is significant because it serves as a strategic platform for showcasing the industry, innovation, and technological potential of Central Asian countries on the international stage.

The participation of the Uzbekcosmos agency in this process deserves special attention. The agency's exhibit at the exhibition showcases the country's achievements in the development of space technologies, their integration into various economic sectors, and the strengthening of scientific potential. Developments in agriculture, ecology, and urban planning based on the use of satellite data are generating significant interest from investors and international partners.

Furthermore, the participation of the Center for Space Monitoring and Geoinformation Technologies, which founded the agency, further enhances the scientific and practical significance of the exhibition. The geoinformation systems, remote sensing technologies, and digital mapping solutions provided by the Center will help take public administration, resource efficiency, and environmental monitoring to a new level. This will facilitate the development of data-driven decision-making in the digital economy.

This exhibition serves as a key driver of industrial development and innovation for Uzbekistan. The Uzbekcosmos Agency and the center it established serve as one of the key institutions showcasing the country's scientific and technological potential through the introduction of advanced technologies.
